Foundation of Analysis - Retail Measurement Data

In graph theory, the Katz centrality of a node is a measure of centrality in a network. It was introduced by Leo Katz in 1953 and is used to measure the relative degree of influence of an actor within a social network. Unlike typical centrality measures which consider only the shortest path between a pair of actors, Katz centrality measures influence by taking into account the total number of walks between a pair of actors. It is similar to Google's PageRank and to the eigenvector centrality.

Katz centrality - Wikipedia

The logic of inexactness, presented in this paper, is a version of the Łukasiewicz logic with predicates valued in $[0, 1]$. We axiomatize multi-valued models of equality and ordering in this ...
