Prescribing for the first time is a nerve-wracking experience. This volume is a direct response to requests from students for a compendium of the 100 most important drugs in the NHS. Key information about the clinical pharmacology and practical prescribing of each drug is presented side-by-side, allowing you to direct your attention as appropriate for your stage of training.

100 Cases in Clinical Pharmacology, Therapeutics and Prescribing explores scenarios commonly seen by medical students and junior doctors in the ward, emergency department, outpatient clinic or in general practice in which an understanding of pharmacology and sound prescribing practice is central to successful clinical management and safe patient care. A succinct summary of the patient's history, examination and any initial investigations is followed by questions on the diagnosis and management of the case. The answer includes a detailed discussion on each topic, providing practical advice on how to deal with the challenges that occur when prescribing, including planning, drug calculations, prescription review and adverse drug reactions. The book will be invaluable during clinical placements and is an ideal companion during preparation for the Prescribing Safety Assessment examination. Making speedy and appropriate clinical decisions, and choosing the best course of action to take as a result, is one of the most important and challenging parts of training to become a doctor. These true-to-life cases will teach students and junior doctors to prescribe appropriately, and to hone their diagnostic and management skills.

This exceptional text builds your knowledge of pharmacology by first providing an overview of pharmacologic principles and then teaching you how to apply those principles to clinical practice. Focusing on applying pharmacologic scientific knowledge to clinical practice, it explains diagnostic and treatment reasoning and rational drug selection, while providing useful clinical pearls from experienced practitioners.

This textbook provides a concise and thorough introduction to clinical appraisal pharmacology from which students can gain a rapid understanding of individual topics within the discipline, and from which they can review and revise certain topics before exams. This is achieved through self-contained topics, with concise text on the left and a diagram on the right to elaborate and reinforce the text. The text has a strong clinical focus and, in the main, sections will relate to particular body systems or the therapy of a disease-class (eg, cancer). Pharmacological principles and mechanisms are covered, but the main focus is on the therapeutic use of the drugs. Sections will cover basic principles of pharmacology, specialized pharmacology, complementary pharmacology, and the vitamins. The text will be written primarily for pharmacy students, but will also be of interest to clinical medical students. The strong clinical focus should also appeal to practitioners.

Written for medical students, trainee doctors and non-medical prescribers, it addresses all aspects of practical pharmacology, explaining drug classes, their mechanisms and effects on the body. Ultimately its focus is on clinical use, so that safe prescribing decisions are based on sound understanding of science - why and how drugs work to treat common conditions. Every chapter provides clear linkages between pathophysiology of disease and drug mechanisms, highlighted in original illustrations that bring together drug mechanisms, pathways and their place in medical management.
